### Research Synopsis

1. *Droplets On-Demand in Nanochannels: New Opportunities for Investigating Chemical Reactivity and Catalysis in Nanoscale Reactors.*  
The goal of this project is to develop a new method for producing attoliter-scale aqueous droplets on demand at the intersection of nanochannels, and to measure single-enzyme kinetics in these droplets.
2. *Addressable Nanopore Array: Multiscale Fluidic Interface to Cell Culture.*  
The focus of this project is to develop and validate a fluid interface to facilitate control and sampling of the local microenvironment surrounding cultured cells.

3. *Nanopost Arrays for Neutron Scattering Investigations of Suspended Lipid Bilayer Membranes.*  
The goal for this project is the demonstration of complete coverage of a nanoporous silicon substrate with a continuous fluid lipid bilayer, to enable new classes of in situ transmembrane structural studies of lipid bilayers and their interactions with membrane proteins and other molecular complexes to be carried out at neutron scattering facilities at ORNL (SNS, HFIR).
4. *Single-Molecule Transcription Kinetics in Crowded and Confined Synthetic Nanoenvironments.*  
The goal of the proposed research is to relate stochastic regulatory protein-DNA interactions at the single-molecule level with phenotypes of simple synthetic inducible gene circuits in increasingly crowded and confined water-in-oil droplets.
