## **Research Synopsis:**

***Electro-optical functionality of nanomaterials and nanomaterial-enhanced composites. Nanomaterials of interest include 0D-1D and 3D assemblies of organic (carbon nanotubes, graphene) and inorganic (including oxides) structures.*** Current research interest is the area of basic and applied research of synthetic multifunctional materials, where within one structure multiple performance objectives could be accomplished. These materials are designed to mimic multifunctionality of natural materials, and based on nano-structures, like carbon nanotubes, which have unique mechanical, thermal and electrical properties. The goal is to translate these unique properties of nanostructures from the nanoscale of nanomaterial to the macroscale of multifunctional composite materials, which should show better power generation, sensing, self-health monitoring and self-repair properties along with the improvement of structural, thermal functionalities. An approach chosen is to develop fundamental knowledge and understanding of interfacial phenomena, where the interplay between the properties of nano- and the bulk material of the composites takes place.
