Research Synopsis

1. **Solvothermal Synthesis of Nanomaterials.** We utilize solvothermal approaches to develop chemistry and techniques necessary to access refractory nanomaterials that are challenging to synthesize with traditional wet methods.
2. **Nanomaterials Characterization.** We are developing new *in situ* characterization approaches using small-angle x-ray scattering (SAXS) to better understand the mechanisms and kinetic of solution-based nanomaterials synthesis.
3. **Catalysis.** We synthesize catalytic nanomaterials such as metals, oxides and graphenic carbons for use as gas-phase catalysts. We study the performance and mechanisms as a function of the nanomaterial properties including size, expression of crystal faces, and support chemistry.
4. **Energy Storage.** We synthesize and study nanomaterials for applications in electrical energy storage systems as electrodes and electrolytes.
5. **Medical Isotope Delivery.** We are working on new nanomaterials-based delivery media for the safe *in vivo* delivery of alpha-bearing isotopes for cancer therapy.
6. **Radiation Detection.** We have worked on a wide variety of scintillating nanomaterials for the low-cost detection of radiation and neutrons.
